

Setups the idnai-* driven package

- Let us call ``$name`` the definitive package repository name, chosen when creating the GitHub repository.
- You should have a ``sketchbook`` where each subdirectory is a package.
 - Each directory corresponds to a git repository, on GitHub, in our context.
 - For instance ``~/sketchbook`` in your home directory.
- In this ``sketchbook`` :
 - 1/ download <https://vthierry.github.io/idnai-make/setup.sh>
 - 2/ run it ``bash ./setup.sh``

=> This interactive simple script will do the job (see next slide)
